# Stage 1

# Stage 2

# Source term

# Next steps

# Source term

	Proton beam energy (MeV)	Frequency (Hz)	Particles incident in final station (p/s)
Stage 1 (p)	15	100	1E10
Stage 1 (C6+)	48		1E9
Stage 2 (p)	127	100	1E10
Stage 2(C6+)	400		1E9

Source	Description
A	Proton/ion plasma source
B	Gabor lenses and collimator (source term exhibited by losses during this first stage of beam acceleration)
C	Source shutter (the shutter between the source stage and the stage 1 experiment)
D	In-vitro Stage 1 delivery (beam bending vertically up to delivery area)
E	Stage 1 beam dump
F	Injection line into FFA
G	FFA acceleration (source term exhibited by the acceleration mechanism of the FFA)
H	FFA extraction (the term attributed to the accelerated beam leaving the FFA)
I	FFA beam dump
J	FFA shutter
K	In-vitro Stage 2 delivery (beam diverted vertically upwards to the Stage 2 delivery area)
L	Stage 2 dump
M	Stage 2 shutter
N	In-vivo line (utilised for treatment in the final evolution of the accelerator)

# Stage 2

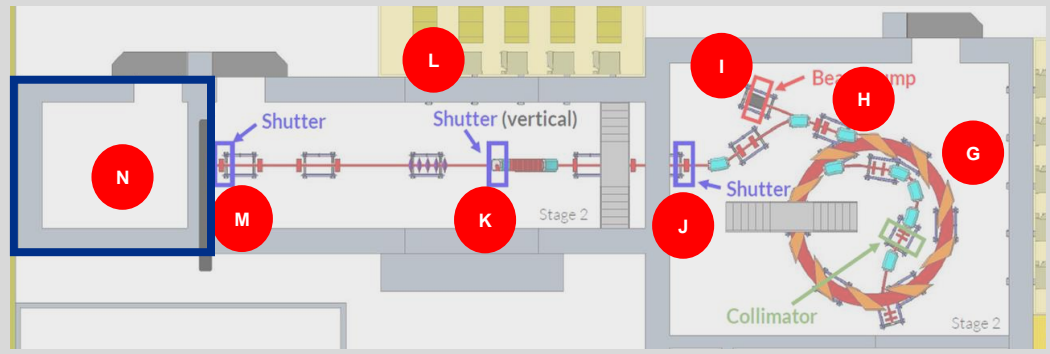

# Stage 2

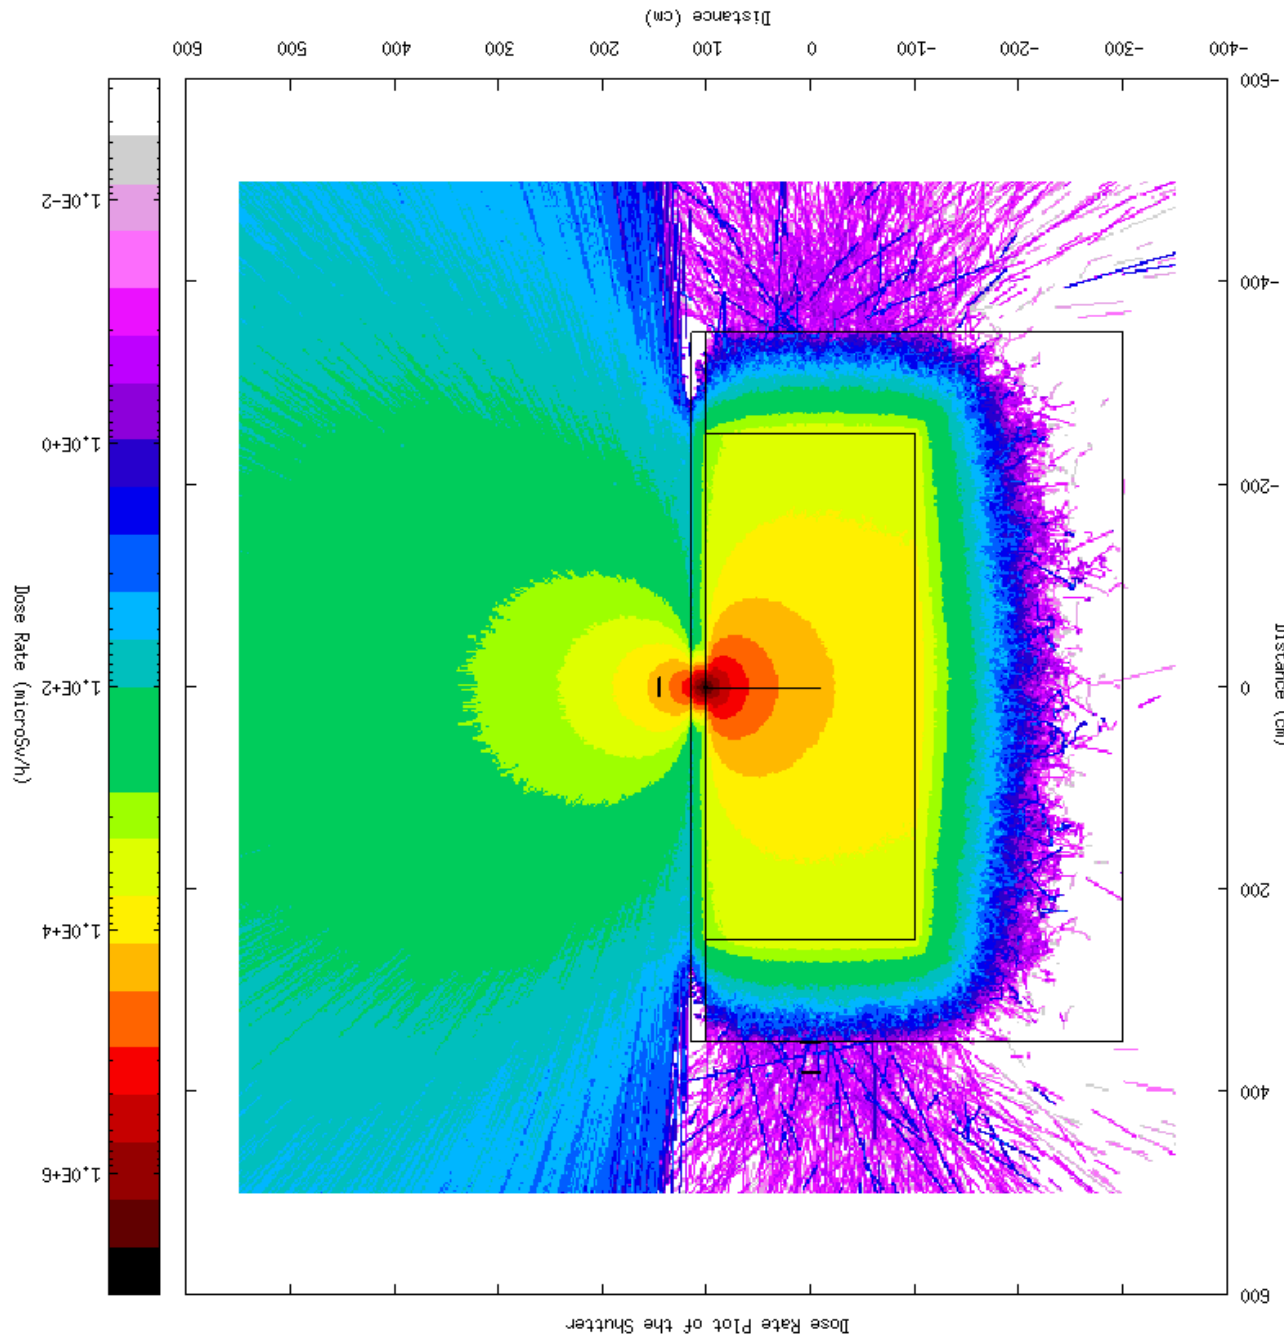

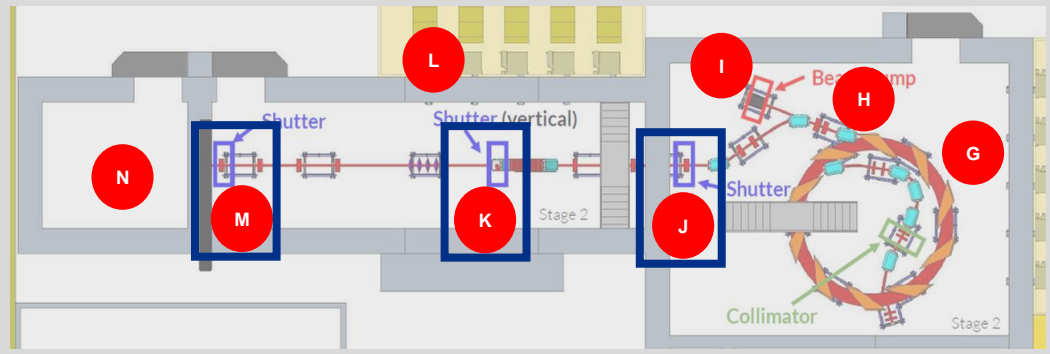

# Stage 2

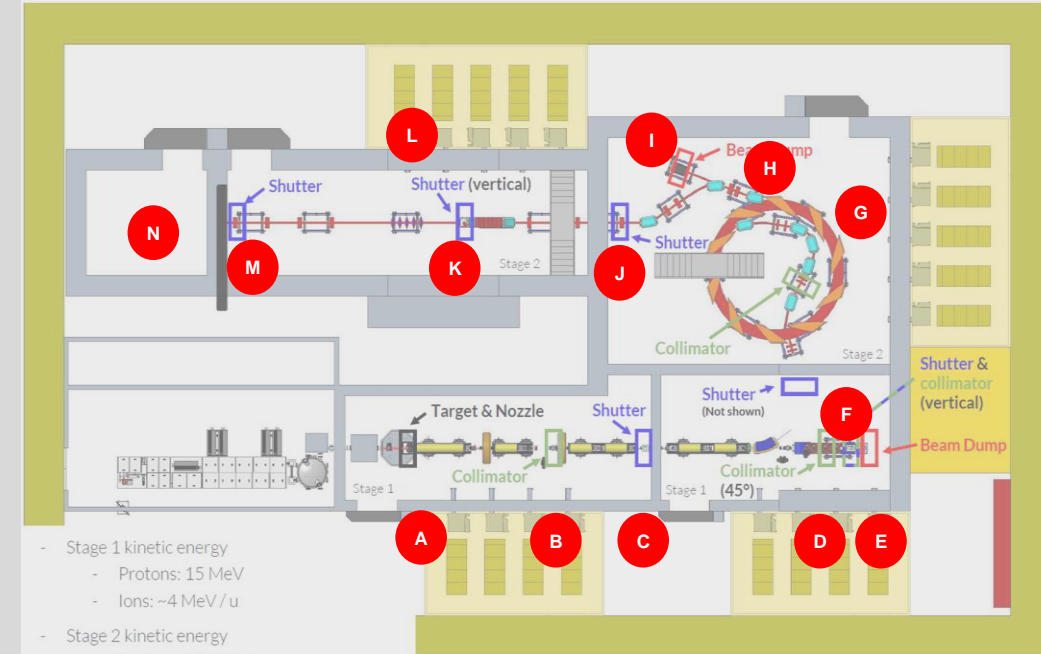

# Stage 2

1. Refine source data (electron source not currently accounted for and spectrum may be pessimistic).
2. Focus the design of dedicated beam dumps and local shielding to reduce some concrete thicknesses (300 cm in some areas).
3. Review access requirements on roof of Stage 2.
4. Design shielded shutters; the tungsten shutter alone is not enough to attenuate a 10 Hz beam to allow access into adjacent areas.
5. Still need to carry out fault scenario and activation analysis.
