Results

Integrated
cross sections

Conclusion

Typically used for performing studies with RIBs (Radioactive Ion Beams) - low intensity → **every ion counts**

Maximise statistics:

- Maximise target thickness
- Maximise (geometric) efficiency

TPCs:

- **Thick** target without loss of resolution
- $\approx 4 \pi$ geometric efficiency
- Extremely-low energy thresholds

Aims

Use a TPC with neutron beams for neutron-induced reactions

Conclusion

TexAT TPC - TEXas Active Target Time Projection Chamber

TPCs can be well-suited to many different types of neutron-induced measurements

Active-target (gas IS the target and readout medium)

TPC filled with CO₂ looking to measure:

- $^{12}\text{C}(n, \alpha_0)$, $^{16}\text{O}(n, \alpha_0)$ and $^{16}\text{O}(n, \alpha_{1,2,3})$ differential cross sections
- UK HRL 5% accuracy for $^{16}\text{O}(n, \alpha_0)$ from $E_n = 2 - 20$ MeV
- Current 30% uncertainty leads to 100 pcm uncertainty for k_{eff}

Can be measured with the TexAT with 50/100 Torr CO₂ gas

Conclusion

How to go from differential to total when you don't measure everything?

$$\sigma = 2\pi \frac{\left(\int_{\theta_l}^{\theta_h} \frac{d\sigma}{d\Omega} \sin\theta d\theta \right) \left(\int_0^\pi \sin\theta d\theta \right)}{\left(\int_{\theta_l}^{\theta_h} \sin\theta d\theta \right)} = 4\pi \frac{\int_{\theta_l}^{\theta_h} \frac{d\sigma}{d\Omega} \sin\theta d\theta}{\int_{\theta_l}^{\theta_h} \sin\theta d\theta}, \quad (1)$$

Just integrate over **the bit you do** have with **appropriate weighting** to account for unmeasured section

With $\sin(\theta)$ weighting, angles around 90° are most important anyway!

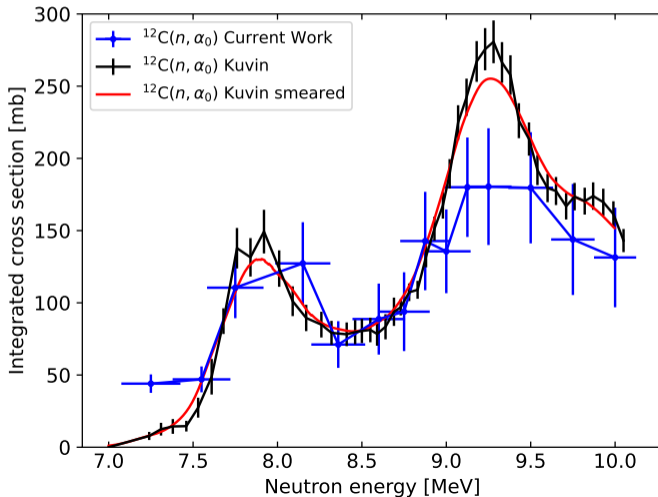

Total cross section: $^{12}\text{C}(n, \alpha_0)$

Conclusion

- Possibility for variety of neutron-induced measurements with a TPC
- Limited by 'good' gases for active target
- Measurements for $^{12}\text{C}/^{16}\text{O}(n, \alpha)$ differential XS to improve R-Matrix evaluations of these reactions at higher energies
- Uncertainty ranges from 7-24% for $^{16}\text{O}(n, \alpha_0)$ (c.f. previous 30%)
- Uncertainty ranges from 15-45% for $^{16}\text{O}(n, \alpha_{1,2,3})$
- Publication in review now. Also at: [arxiv:2601.02841v1](https://arxiv.org/abs/2601.02841v1)
