Transverse Kinematic Imbalance Study in ProtoDUNE-SP for the interaction proton-argon

Joint APP/HEPP Meeting 2022

6th April, 2022

Stefano Vergani for the DUNE Collaboration

- Transverse Kinematic Imbalance Analysis
- DUNE and ProtoDUNE Single Phase
- Primary Particle Selection
- Interaction Selection
- Observables in the pion study

Transverse Kinematic Imbalance: Scope

Transverse Kinematic Imbalance (TKI) is a technique used to measure intranuclear dynamics in particle – nucleus interaction.

These dynamics are poorly understood -> important to create better models.

Better models will turn into better simulations -> more precise measurements in particle physics.

Transverse Kinematic Imbalance in Neutrino Physics

TKI analysis is applied to a variety of neutrino physics experiments studying different interactions.

- T2K Off-Axis Near Detector: $\nu_{\mu} + p \rightarrow \mu^{-} + \pi^{+} + p$ (<https://arxiv.org/abs/2102.03346>)
- MINERvA: $\nu_{\mu} + n \rightarrow \mu^{-} + p$ ([Phys.Rev.D 101, 092001, 2020](https://arxiv.org/abs/1908.07238))
- ProtoDUNE Single Phase (SP):
 1. $\pi^{+} + p(^{40}\text{Ar}) \rightarrow \pi^{+} + p$
 2. $\pi^{+} + n(^{40}\text{Ar}) \rightarrow \pi^{0} + p$
 3. $p + ^{40}\text{Ar} \rightarrow p + p$

TKI Observables for $p + {}^{40}\text{Ar} \rightarrow p + p$

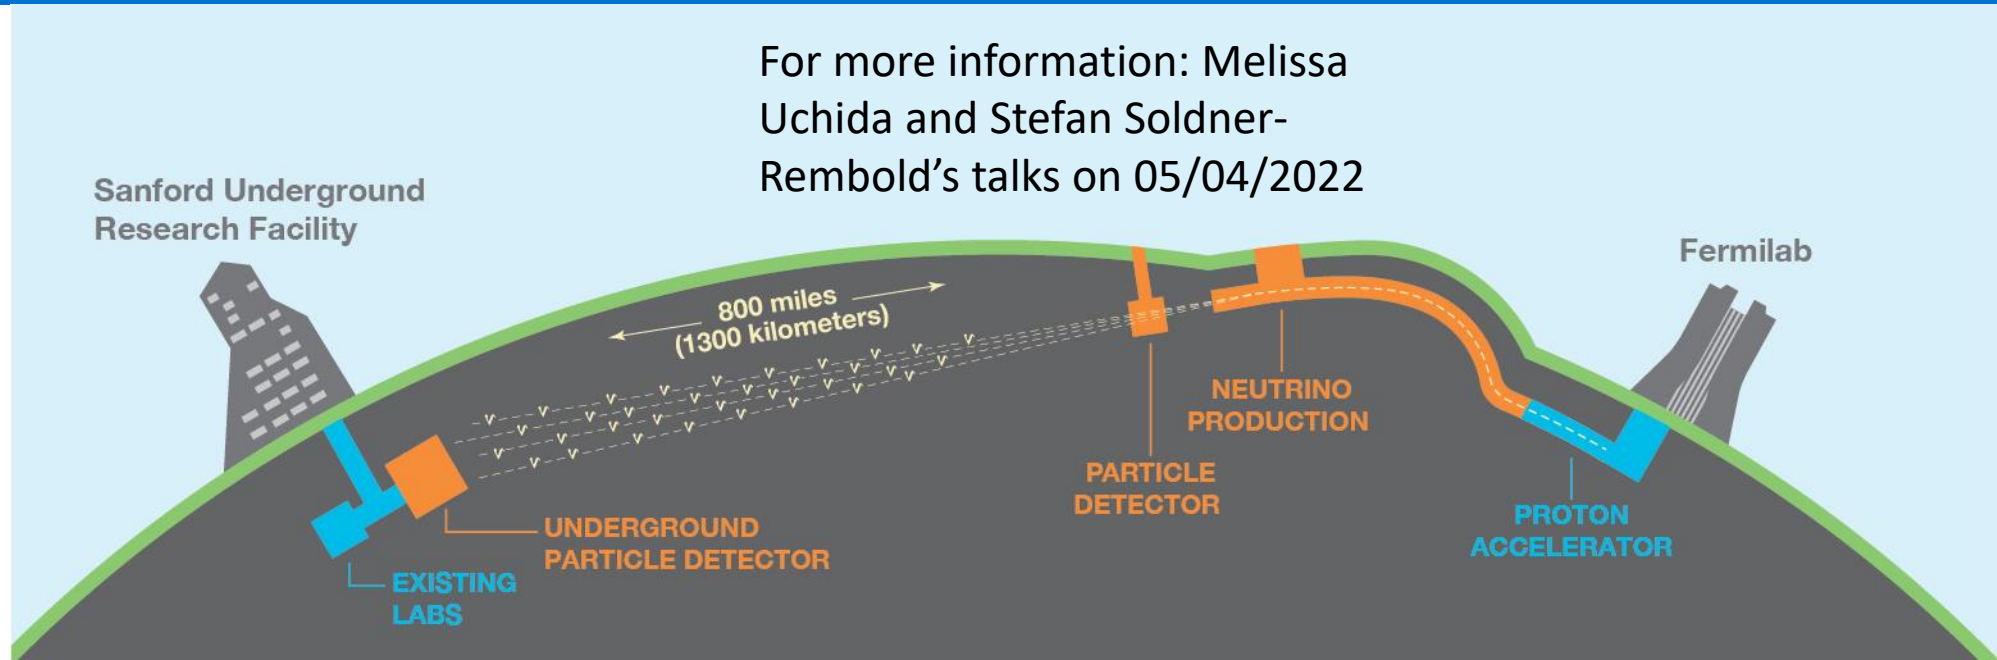

[Lu. *et al.* [Phys. Rev. D92, 051302 \(2015\)](#), Lu. *et al.* [Phys. Rev. C94, 015503 \(2016\)](#)]

Transverse Momentum Imbalance $\delta\vec{p}_T \equiv \vec{p}_T^{p1} + \vec{p}_T^{p2}$

Transverse Boosting Angle $\delta\alpha_T \equiv \arccos \frac{-\vec{p}_T^{p1} \delta\vec{p}_T}{p_T^{p1} \delta p_T}$

Anode Plane Assembly (APA)

DUNE Far Detector and ProtoDUNE Single Phase

Primary Particle Selection

Primary Particle Selection

1) Primary particle identified as proton from beam instrumentation

2) Primary particle identified as track inside the detector

3) Primary particle's interaction must satisfy requirements

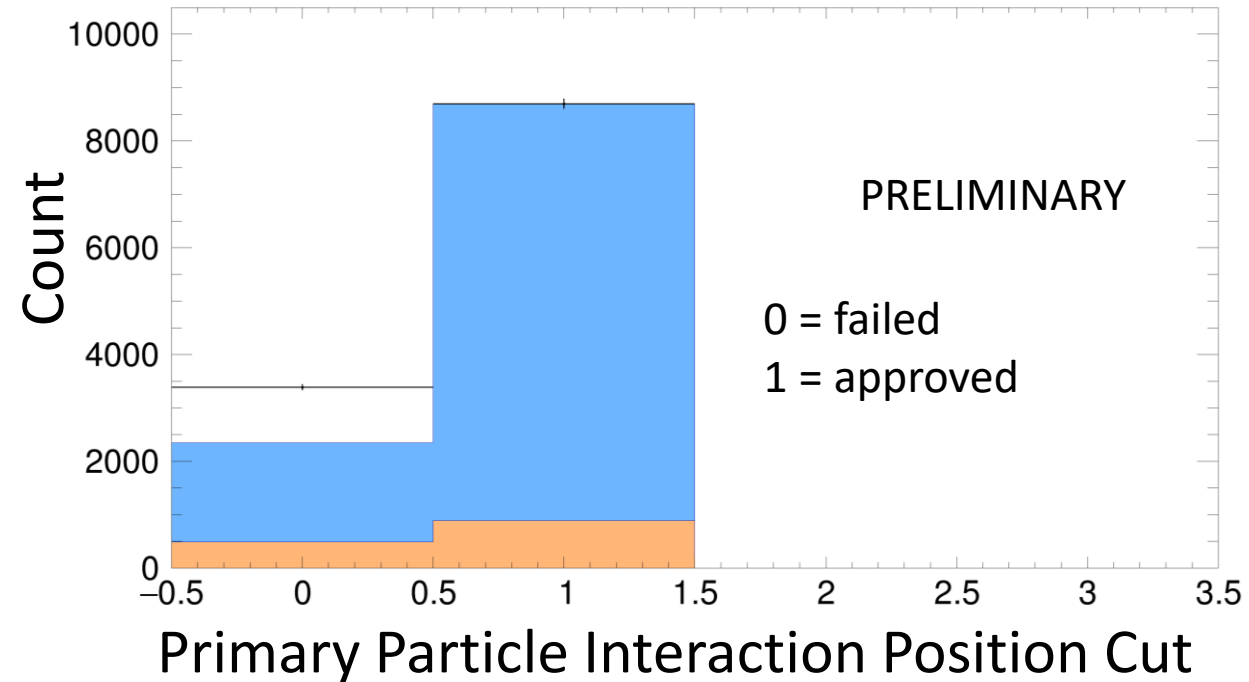

4) Interaction inside fiducial volume

Primary Particle Cuts

ProtoDUNE Single Phase

ProtoDUNE Single Phase

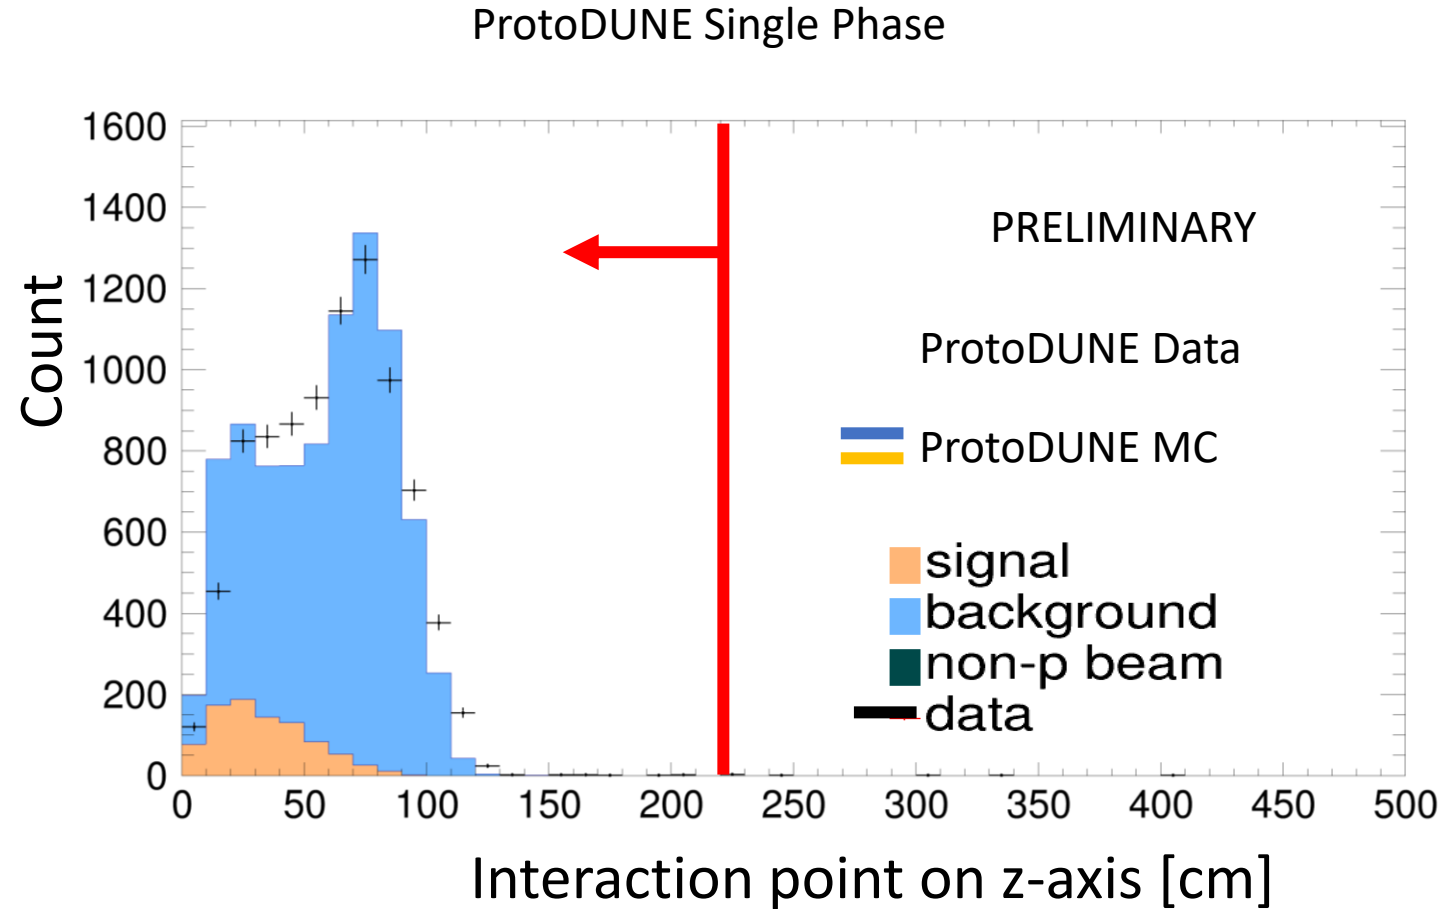

Signal = p-> p+p event

Background = any other proton beam event

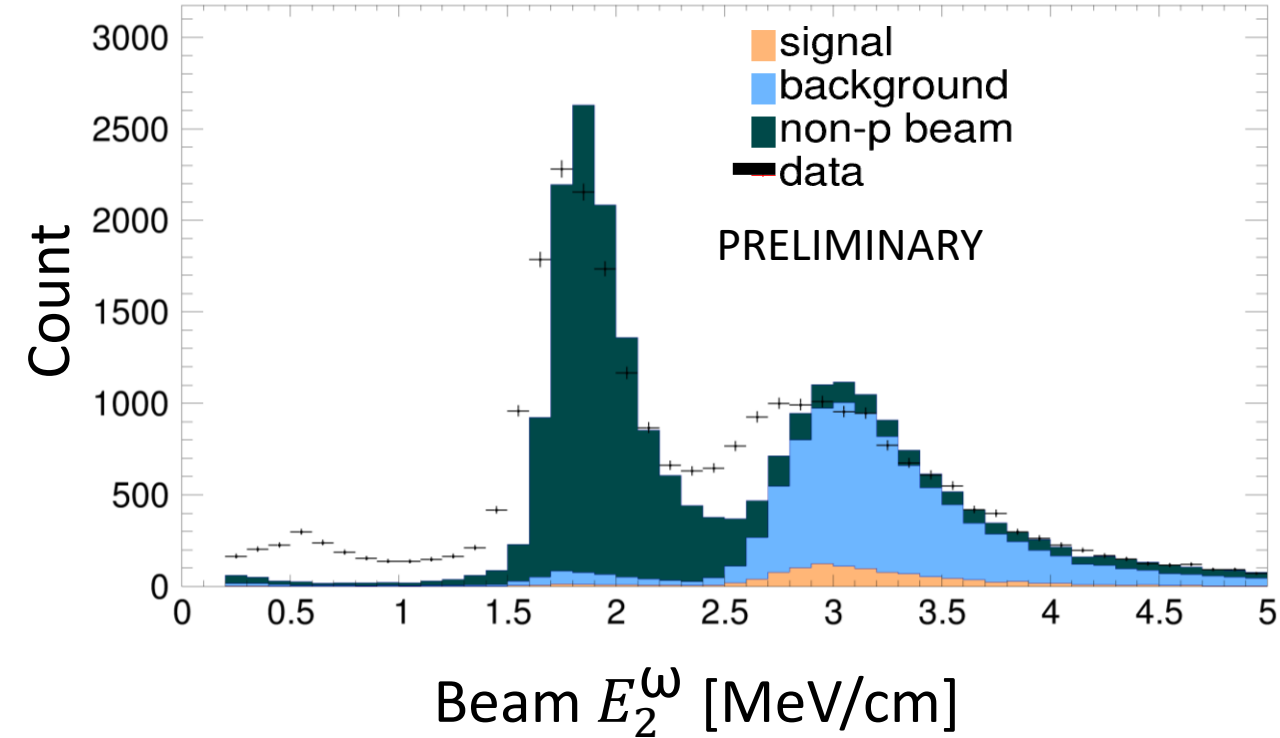

signal

non-p beam
data

Beam Cuts

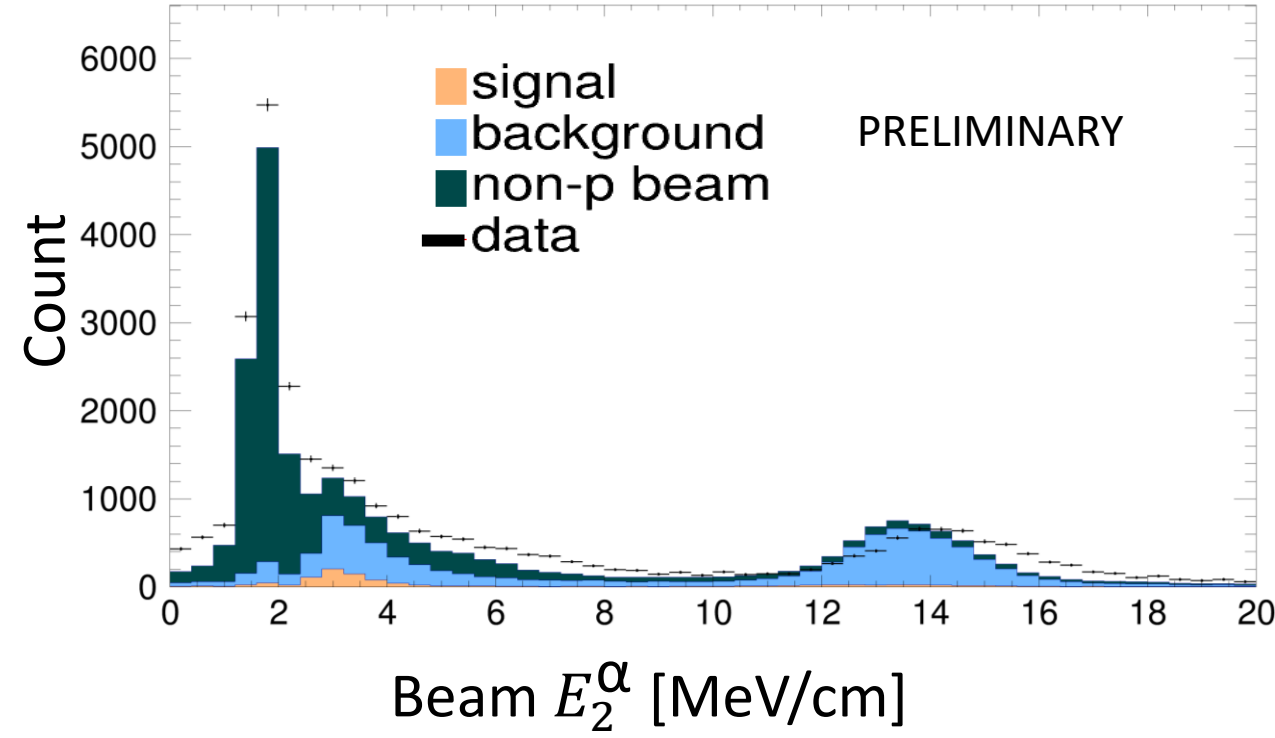

Before Primary Particle Cuts

ProtoDUNE Single Phase

ProtoDUNE Single Phase

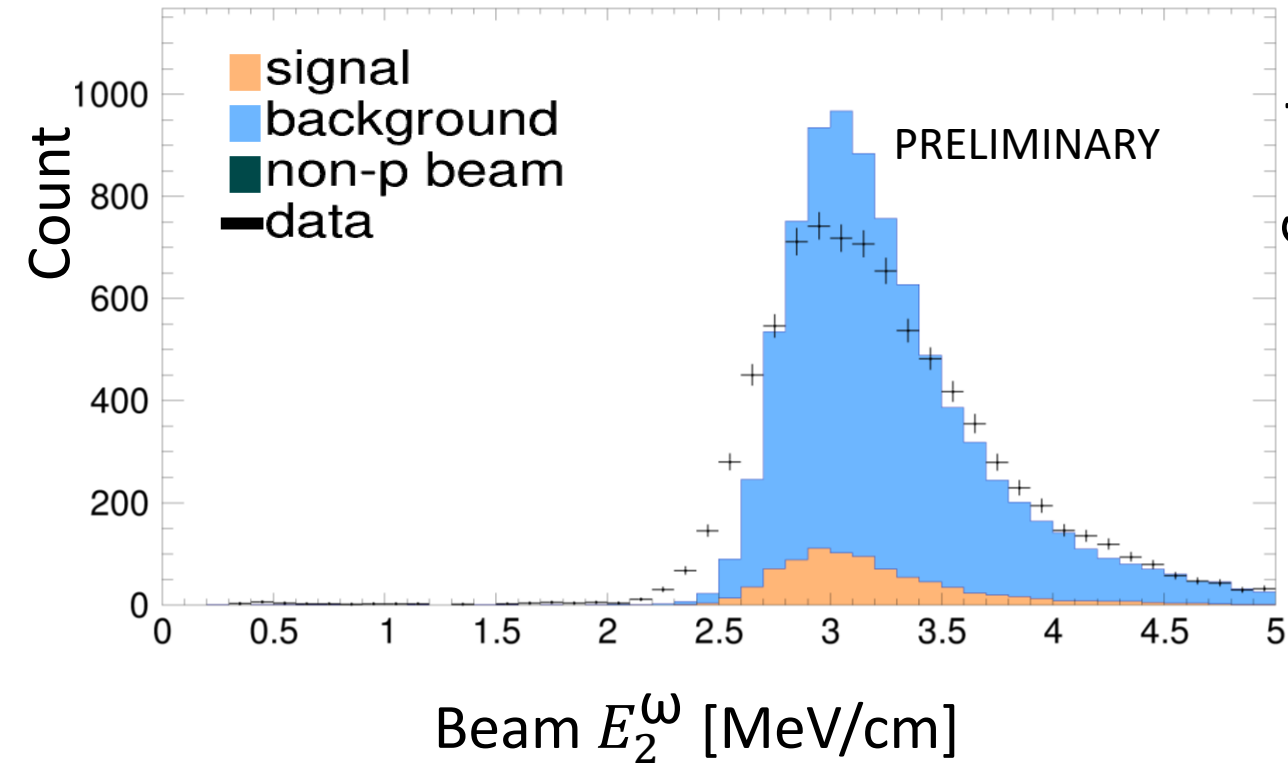

E_2^ω is the dE/dx at the vertex far end, the beam entrance

E_2^α is the dE/dx at the vertex near end, the beam interaction point. This is the Bragg peak region

After Primary Particle Cuts

Convolutional Neural Network and TrackScore

NEW PAPER FROM DUNE COLLABORATION
<https://arxiv.org/abs/2203.17053>

TrackScore

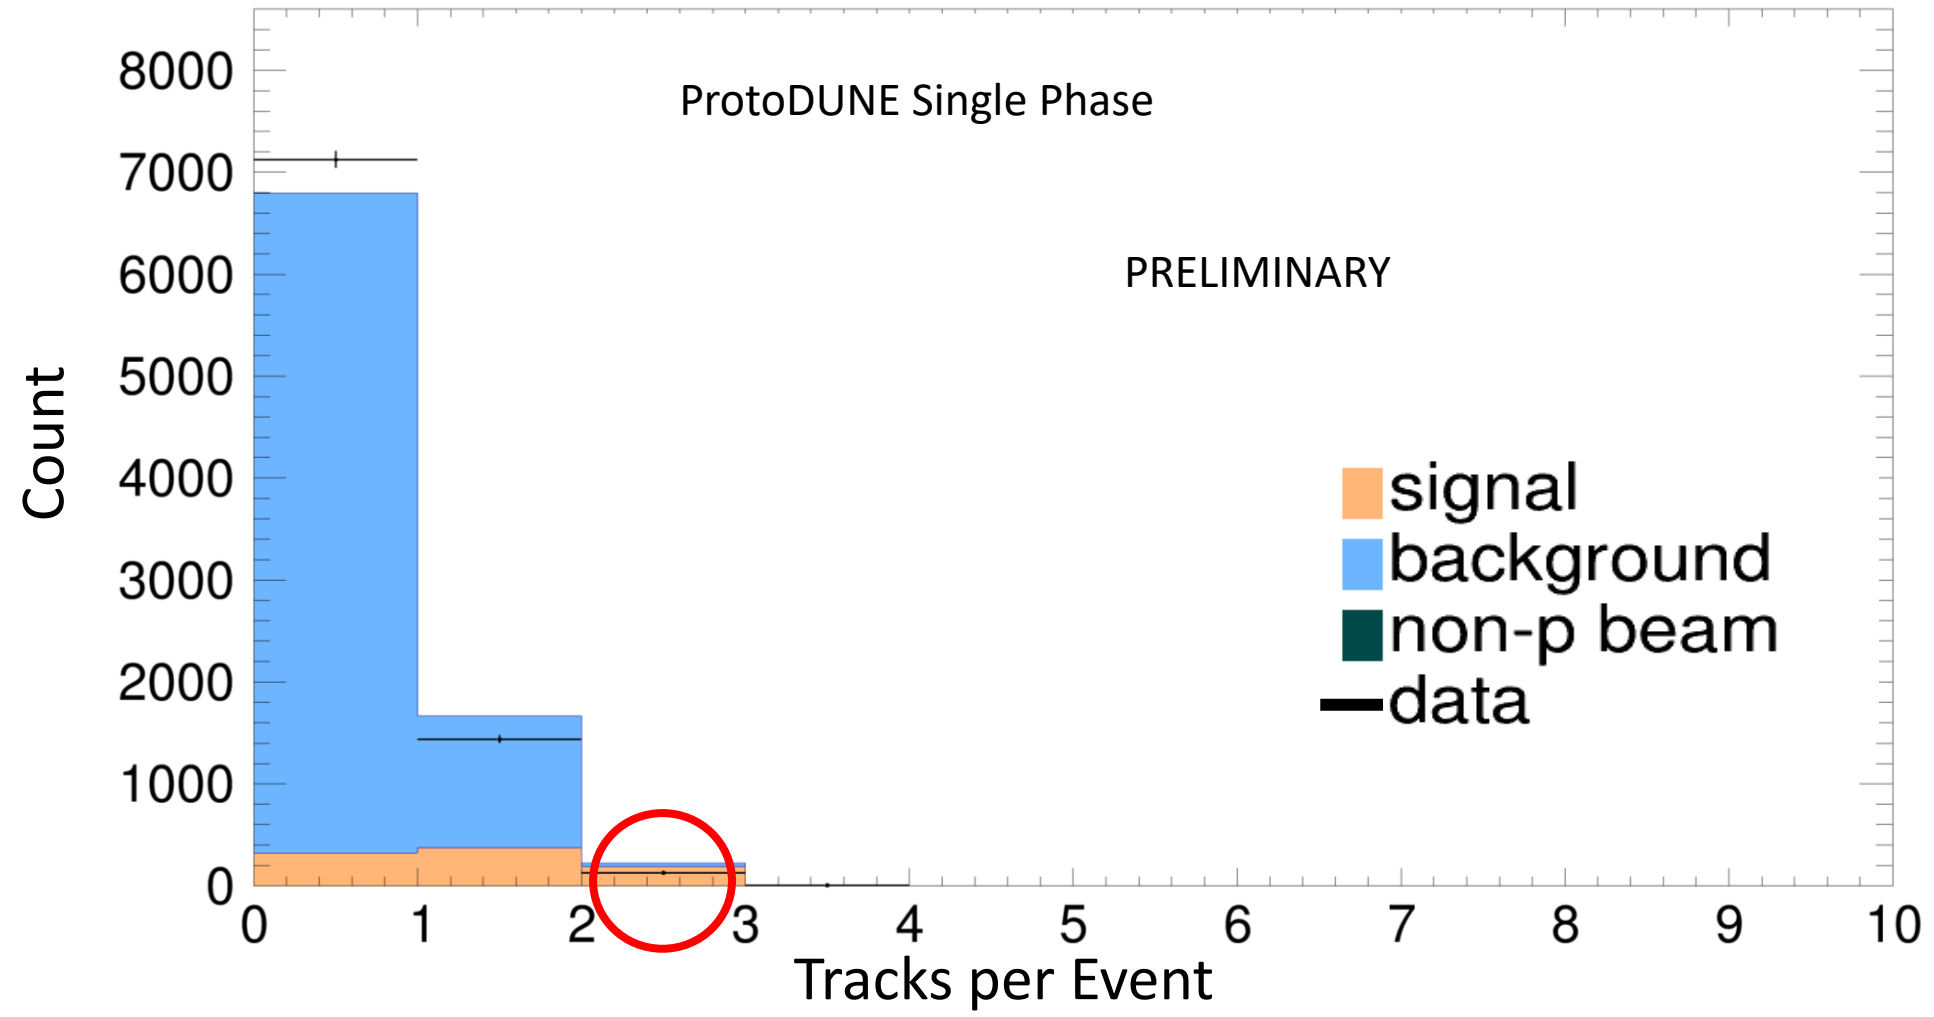

Trackscore appears to be flat after 0.5 for protons, therefore we keep 0.5 as threshold for protons.

Number of Hits

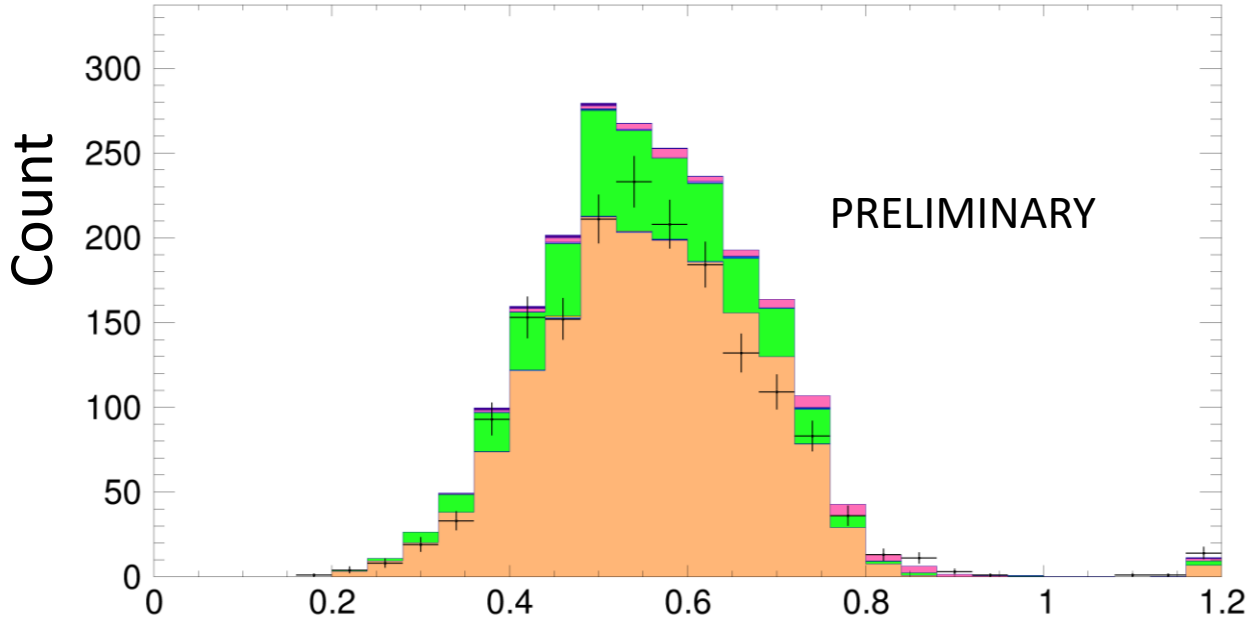

We take deposits with $20 < n_{hits} < 220$.

Back-Up Slides: Quick Review of the Beam Cuts

- Beam Particle Identification: identified a protons via PDG candidates
- Beam Track-like: selected only events with a track-score value above a certain threshold
- APA3: a cut on the end z-plane position
- Beam Position: a collection of subcuts
 1. 3 sets of $|\Delta(x/y/z)/\sigma_{(x/y/z)}| \leq 3$, where the sigmas are hardcoded values and delta is the difference between the beam start and the mean beam start
 2. Oval cut $\sqrt{((\Delta x/\sigma_x)^2 + (\Delta_y/\sigma_y)^2)} < 3$
 3. Angular cut
