

Multiple shape coexistence around $Z = 30-48$ studied with beyond-mean-field methods

Wednesday, 2 August 2023 09:00 (30 minutes)

Nuclei in the region of the nuclear chart between $Z = 28$ and 50 magic numbers show a collective behavior that can be attributed to the appearance of quadrupole shape mixing and/or coexistence. Advanced energy density functional (EDF) methods, including symmetry restorations and axial and triaxial shape mixing, are the perfect tools to study these phenomena from a microscopic point of view. In this contribution I will present recent systematic calculations performed with the Gogny EDF comparing with the available experimental data. Furthermore, I will focus on the appearance of multiple shape coexistence in the nucleus ^{84}Mo .
